<b>3</b>	<b>Figures</b>	<b>2</b>
<b>4</b>	<b>Citations</b>	<b>2</b>
<b>5</b>	<b>References</b>	<b>3</b>

## 1 SI Units

The package `siunitx` allows you to correctly use SI units (like degrees Celsius). You can do proper SI formatting with `\SI{1}{\meter}` to render as 1 m. See [the siunitx documentation](#) for more details. I've also included the molar symbol as a special command: `\SI{1}{\Molar}` becomes 1 M.

## 2 Chemical equations

The package `mhchem` allows you to make chemical formula, like  $\text{MgCl}_2$ . The full documentation is available [here](#).

## 3 Figures

I've included a bunch of figure snippets at the end of the source for this file. The best practice is to organize your images in a `./img/` directory. You can then link to a figure by referencing the label in `\ref{fig:figlabel}`. For example, we plate our cells on a soft silicone substrate embedded with fluorescent beads for traction force microscopy, shown in Figure 1. You can read more about cross-referencing [here](#).

## 4 Citations

You can easily cite sources using the cite keys for the entries in your `.bib` file. The bibliography styles are set and the bibliography is generated using

**Figure 1:** HEK 293 cell transfected with ACTN4-hGFP and Nuc7-EBFP plated on a 10kPa PDMS substrate embedded with a monolayer of poly methylmethacrylate DiI-core beads.

`\bibliographystyle{unsrt}`

`\bibliography{term_paper}`

at location where you want your bibliography to be placed.

Here's an example:

My lab developed a technique for traction force microscopy on soft silicone substrates [1]. Deformation has been observed to be the independent variable in mechanotransduction [2, 3].
